

Encryption Plus® Hard Disk

Powerful security. Simple to use. Superior service & support.

**hard
disk**

- **100% Data Protection**
- **Simple to Use**
- **Low Total Cost of Ownership**

Encryption Plus® Hard Disk provides full hard disk, on-the-fly data protection that authenticates users *before* the Windows operating system loads into memory. Runs on Windows NT/2000/XP and Windows Server 2000 and Windows Server 2003.

Easy to configure, simple to deploy, and easy to maintain, Encryption Plus Hard Disk offers the lowest total cost of ownership of any solution.

BENEFITS OF ENCRYPTION PLUS HARD DISK

Simple to Use—Users *never* have to change the way they work. At the start of every session, users simply log on and Encryption Plus Hard Disk's advanced Single Sign-On and Password Synchronization functions will transparently and simultaneously grant users access to their computers and the network.

Lowest Total Cost of Ownership—Encryption Plus Hard Disk offers *the lowest total cost of ownership of any competing solution*. It requires no additional software or hardware purchases, no certificates or certificate fees, no directory, no special administration or staffing, and no user training. With Encryption Plus Hard Disk, *there are no hidden costs*.

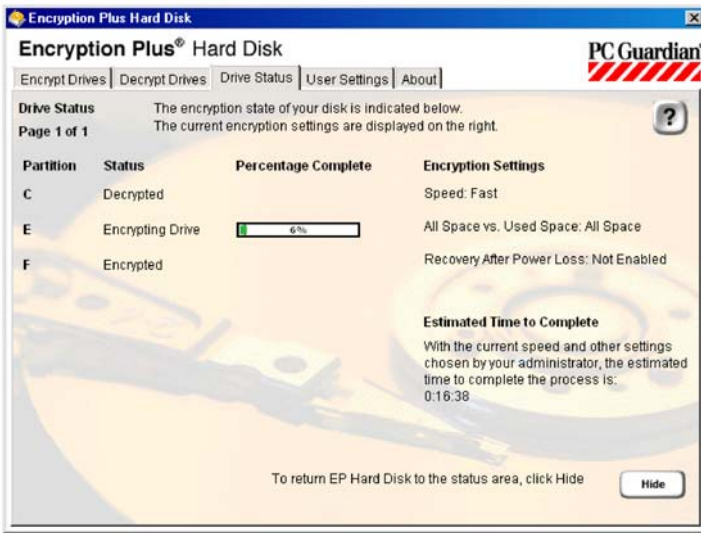

Eliminates Costs Associated With Password Resets—Encryption Plus Hard Disk includes Authenti-Check®, a self-service password reset method that can *eliminate* support calls due to forgotten passwords.

Improves Password Security—Encryption Plus Hard Disk's Password Management feature provides administrators granular control over users' password expiration, reuse, length, and guessing, as well as the use of special characters.

Protects Data With a Powerful Algorithm—Encryption Plus Hard Disk uses a FIPS 140-2 compliant AES algorithm with a 256-bit encryption key—backed by PC Guardian's acclaimed customer support.

Lowest Total Cost of Ownership

Encryption Plus Hard Disk provides the lowest Total Cost of Ownership of any competing solution. *There are no hidden costs.*

- *No* need to purchase or install server software or hardware; create or maintain databases; or create, purchase, or exchange Digital Certificates.
- Installs and updates *easily* over a network using standard network installation tools.
- *Requires little-to-no user training.* Users must know how to create a password—that's all!
- *Completely eliminates* support costs associated with forgotten passwords.

How Encryption Plus Hard Disk Works

Includes an easy-to-follow wizard in the Administrator Program that allows control over:

- User password settings
- User account expiration
- Keyboard languages (English, French, German, Scandinavian, Italian, Spanish, Portuguese, Japanese, and more)
- Single Sign-On/Password Synchronization
- Hibernation support
- Remote and/or self-service password recovery
- Initial Encryption Speed settings

Installation Is Easy and Fast

Encryption Plus Hard Disk can be deployed and installed remotely over a network or administrators can install the program using standard imaging tools.

The speed of the Initial Encryption can be set, based on user needs and administrator requirements. Faster speed settings draw more resources from the microprocessor, but a slower speed allows users to continue to work while Initial Encryption continues in the background—with no noticeable impairment in the performance of computers or user productivity.

No Impact on Users

Once the User Program is installed, each user creates a password and Initial Encryption begins, immediately and automatically. Thereafter, each time their PCs boot, users simply enter their passwords. Encryption and decryption work on the fly, transparently, and without users having to do a thing.

Centralized Management and Control

With the optional **Encryption Plus Management Console**, administrators can confirm policy settings, update settings in real time on users' computers (no matter where users are located), and audit user activities—all from one central location.
