DigiPortal Announces ChoiceMail Enterprise Version 4.x That Combats Latest Email Scams

ORLANDO, FL—February 14, 2007- DigiPortal Software Inc., a leading developer of anti-spam software, introduced enhancements to the company's flagship ChoiceMail Enterprise anti-spam solution that includes advanced solutions to detect and eliminate the latest email scams.

Deployed in approximately 500 organizations, ChoiceMail Enterprise Edition provides both users and IT administrators a variety of active and passive spam detection and prevention features. The new release has the ability to more easily augment the approved senders list and to identify when spammers are "faking the from address" on emails. ChoiceMail Enterprise users report an average time savings per employee of 15 minutes per day.

Fully compatible with any corporate email server and requiring no integration, the ChoiceMail Enterprise system gives businesses the ability to stop the endless flow of spam from reaching their email server, protecting the organization from the stress of unwanted email traffic, the risk of accidental virus or web bug activation and inappropriate content in the workplace. ChoiceMail also provides the email mail server the added protection from being used as a relay mechanism. ChoiceMail Enterprise has a unique architecture that does not require constant updates to be effective in blocking spam.

Users can access the ChoiceMail system via any standard Web browser operating on any operating system, including Windows, Macintosh and Linux as well as wireless devices that incorporate operating systems such as Blackberry, Palm and Pocket PC. This flexibility allows them to manage and view their spam free email while out of the office. ChoiceMail Small Business (CMSB) offers the same capabilities and benefits for organizations that do not already have their own email server.

DigiPortal's newest installment of ChoiceMail Enterprise Edition, Version 4.x, has significant performance enhancements in the main processing engine, contains outbound server improvements for both performance and stability, has extensive searchable documentation in the standard CHM format and works with several SQL database systems, significantly reducing memory requirements and increasing responsiveness to a large number of email recipients.

"Many of the new enhancements in ChoiceMail Version 4.x are a result of customer input and feedback," said Nebojsa Djogo, Vice President of Software Development for DigiPortal. "Businesses can rest assured that their employees are protected from the latest email scams and methods incorporated by spammers."

Based on the individual user's own decisions, Version 4.x incorporates permission rules used to delete messages that are guaranteed to be email spam, allowing even more control to completely eliminate real spam.

Other major features in ChoiceMail Version 4.x Enterprise Edition include:

- Improved security of web browser access
- Updated information in Identity Verification process to make it more compatible with older style content filters.
- Improved user interface in the administrative area.
- Simplified installation process.

Availability & Pricing:

ChoiceMail Version 4.x Enterprise Edition is available immediately. Contact DigiPortal at 407 333-2488 or rweindruch@digiportal.com for more information.
